do{
    for(int i=0;i<5;i++)
```

```
        cout << arr[i] << ' ';
    cout <<'\n';
}while(next_permutation(arr,arr+5));
//also prev_permutation exist

//Combination
int arr[5] = {0, 0, 0, 1, 1}; // total : total cnt, 0 cnt : choose cnt
do{
    for(int i=0;i<5;i++)
        if(arr[i] == 0)
            cout << i+1 << ' ';
    cout <<'\n';
}while(next_permutation(arr,arr+5));
```

### 2.12 Lifting The Exponent

For any integers $x$, $y$ a positive integer $n$, and a prime number $p$ such that $p \nmid x$ and $p \nmid y$, the following statements hold:

- When $p$ is odd:
  - If $p \mid x - y$, then $\nu_p(x^n - y^n) = \nu_p(x - y) + \nu_p(n)$.
  - If $n$ is odd and $p \mid x + y$, then $\nu_p(x^n + y^n) = \nu_p(x + y) + \nu_p(n)$.
- When $p = 2$:
  - If $2 \mid x - y$ and $n$ is even, then $\nu_2(x^n - y^n) = \nu_2(x - y) + \nu_2(x + y) + \nu_2(n) - 1$.
  - If $2 \mid x - y$ and $n$ is odd, then $\nu_2(x^n - y^n) = \nu_2(x - y)$.
  - Corollary:
    - If $4 \mid x - y$, then $\nu_2(x + y) = 1$ and thus $\nu_2(x^n - y^n) = \nu_2(x - y) + \nu_2(n)$.
- For all $p$:
  - If $\gcd(n, p) = 1$ and $p \mid x - y$, then $\nu_p(x^n - y^n) = \nu_p(x - y)$.
  - If $\gcd(n, p) = 1$, $p \mid x + y$ and $n$ odd, then $\nu_p(x^n + y^n) = \nu_p(x + y)$.

# 3 Data Structure
